TurboBeam

Distributed in USA by Encenx Corporation

A NEW GENERATION IN TURBINE VENTILATORS

TurboBeam is the first turbine ventilator to provide roof space ventilation and enable natural light to enter the attic spaces.

These dual features provide the following benefits for homeowners:

1. **Better summer comfort.**

TurboBeam removes very hot air from the attic space enabling it to be replaced by cooler, ambient air. This effect is particularly pronounced at night. The result is reduced roof space temperatures and less radiation of heat into the home.

2. **Illumination of the attic space.**

TurboBeam uses a clear, acrylic turbine head and a highly reflective aluminum throat. This enables sunlight to be captured and focused into the attic space. The sun drenched attic space assists visibility and creates an environment that deters termites.

- **The technology leader.** Sturdy acrylic construction with UV inhibitors, vertical vanes and permanently lubricated stainless steel bearings ensure long life and efficient operation.
- **Extremely cool in summer.** The vertical vane design provides TurboBeam with efficient air discharge attributes thereby providing superior cooling in summer.
- **Withstands severe wind and rain.** In independent laboratory trials, TurboBeam withstood wind velocities of 149 mph (240km/hr) and satisfied the International Rain Dynamic Penetration Test.
- **Fits all roof types.** TurboBeam's "Vari-Pitch" base and flashing fits any roof type with slopes zero to 45°. Installation is a simple matter.
- **10 Year Warranty.** Twin precision stainless steel bearings enable a 10 year extended warranty to be offered.

'TurboBeam gives both Ventilation and attic light. Helps keep rodents and roof termites away.'
